

## Brainstorming & Idea Prioritization Template

|                      |                                             |
|----------------------|---------------------------------------------|
| <b>Date</b>          | 12 July 2026                                |
| <b>Team ID</b>       | [Insert your assigned Team ID]              |
| <b>Project Name</b>  | Emotion Detection & Learning Support Engine |
| <b>Maximum Marks</b> | 3 Marks                                     |

### Step 1: Brainstorm and Idea Listing

Each team member lists out as many ideas as possible without judging them at this stage.

| S.No | Team Member          | Idea / Suggestion                                                                                                                                                                   | Category                                       | Group No. |
|------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------|-----------|
| 1    | Venkata Siva Adapa   | Use dual models (BiLSTM + BERT) together so predictions are cross-checked for higher confidence, and integrate Gemini AI to generate natural, personalized guidance.                | Model Architecture / AI Response Generation    | 1         |
| 2    | Lakshmi Sri Vyshnavi | Detect mixed / secondary emotions (e.g., Confused + Curious) instead of a single label, and build a Streamlit analytics dashboard to visualize emotion trends and model confidence. | Model Architecture / Analytics & Visualization | 2         |
| 3    | Sammer Shaik         | Log every interaction (input, emotion, confidence, response) to CSV for later analysis, and add an offline fallback response mode in case the Gemini API is unavailable.            | Data Logging / Reliability                     | 3         |

### Step 2: Idea Prioritization

Rate each grouped idea on feasibility and importance, then select the final idea(s) to move forward with.

| Group No. | Final Idea                                                                                        | Feasibility (High/Medium/Low) | Importance (High/Medium/Low) | Priority | Selected (Yes/No) |
|-----------|---------------------------------------------------------------------------------------------------|-------------------------------|------------------------------|----------|-------------------|
| 1         | Dual-model (BiLSTM + BERT) emotion detection with Geminipowered personalized guidance             | High                          | High                         | 1        | Yes               |
| 2         | Mixed-emotion detection with a Plotly-based analytics dashboard for emotion and confidence trends | High                          | Medium                       | 2        | Yes               |
| 3         | CSV interaction logging with an offline fallback handler for reliability                          | High                          | Medium                       | 3        | Yes               |
